3N Solutions Sp. z o.o. specializes in comprehensive maintenance and cleaning of electrical equipment.

We have experience in the maintenance of power components working under high, medium and low voltage. Our technology is based on an innovative cleaning medium which consist of the unique gas mixture. This technology allows maintenance without downtime in production and extends the life of components.

After-fire cleaning. Our dry gas mix technology allows to remove 100% of soot from components and saves up to 90% of them. The time to remove damage caused by fire is very short, and the components are restored to their functional state in less time than required for the replacement of burnt wiring.

Hydrodynamic cleaning. The high pressure solutions we use enable cleaning and removal of concrete, corrosion, rust, paints, hard deposits and many other coatings that are difficult to remove. Using mobile aggregates and specialized nozzles, we can access places that are impossible to reach.
