**Machining**  
**Surface treatment**  
**Cutting**  
**Other services**

The company was established in 1995 in Tarnów. We are producer of high-quality turned and milled components to individual customer orders, based on technical documentation provided by the client or on our own designs. The knowledge and experience of our designers allows them to analyze, understand, and recreate a finished component or part. This requires our engineers to prepare precise technical drawings based on an existing component (reverse engineering).

We also offer anodizing (it permanently protects against corrosion and makes the metal surface resistant to abrasion and damage) and galvanizing (provides effective corrosion protection for a variety of steel components).

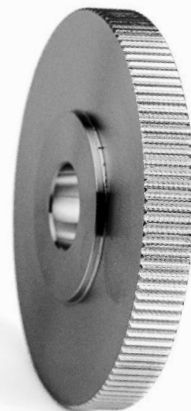

We manufacture parts from materials such as: PTFE, PA, PP, PVC, POM, PET, PEEK, PEHD500/1000, carbon steel, stainless steel, aluminium, and non-ferrous metals. With our modern machine park and qualified employees we are able to realize advanced projects.

Industries we cooperate with include machinery manufacturing and industrial automation, automotive, railway, agricultural and food industries, as well as other sectors requiring precision CNC components.
